

WALLIX is a **European publisher** of cybersecurity software and **expert in Identity and Access solutions**.

Responding to regulatory developments and cybersecurity challenges that affect all businesses, WALLIX solutions protect **against cyberthreats, theft and data leaks linked to stolen credentials and misappropriated privileges**.

WALLIX provides solutions to fit in the **Zero Trust framework**.

WALLIX Bastion is a privileged access management software suite (PAM / PEDM) used to manage, control and trace privileged user access while securing the passwords of IT equipment and infrastructure applications. By applying the principle of least privilege, administrators also no longer necessarily need to have all the privileges on applications, scripts or processes available on a server to perform a specific task. With the Bastion, you can view users' sessions in real time and record their activity for audit or compliance purposes, or to terminate suspicious activity.

WALLIX BestSafe is an endpoint privilege solution (EPM) eliminating the risks associated with overprivileged users and preventing the spread of malware, crypto viruses, and ransomware attacks. WALLIX BestSafe makes it possible to eliminate local administrators on workstations by granting specific rights to each user and distributing privileges to the applications and processes instead of the users themselves. WALLIX BestSafe is the compromise between security and productivity; local non-administrator users can still execute tasks requiring privileges without the help of IT teams and without jeopardizing the organization's security.

WALLIX Trustelem (Identity as a Service – IdaaS) is a service platform to unify, simplify and control user access to any application (administrators and end users). This solution reduces the risk of cyber-attacks by increasing identity and access security and offers efficient administration tools to reduce IT teams' workload. Service users can easily connect through a customized dashboard, reset their password without requesting the IT team's assistance, and have the guarantee of secure authentication, appropriate for the nature and type of application being used.

WALLIX Authenticator: a quick and easy way to limit identity theft and cyber-attacks with a Multi-Factor Authentication (MFA) solution. The user access requiring several forms of identification to eliminate the risks associated with authentication by password alone (e.g. pin code, fingerprint). It does also deliver access to the specific resources that the user needs, with systematic checking of the requesting user's identity across the extended scope of the company: internal and external, remote working and teleworking.

As working together makes us stronger, WALLIX offers its products and services through a global Partner eco system who brings their expertise to deliver end to end solutions to the market.

WALLIX also have customer success representatives to manage a follow the sun maintenance service to support partners and customers all over the world (1 centre in Vietnam, 3 centres in Europe and 1 in North America).
